

BlockPro — App Screens

A visual reference of the BlockPro Flutter app, covering every main screen and its key state variations.

Captured: 25 June 2026 · **Device:** Pixel 3a (Android 12, 1080 × 2220) · **Build:** v1.0.0 (1) · live screenshots from the running app with real synced data.

Data loading: There is no longer a separate "initial sync" screen. After login the app goes straight to the Blocks list and downloads everything **in the background** (see [§2.1](#)). The manual **Refresh** now uses that same background flow — it no longer shows a blocking progress dialog.

Contents

1. [Onboarding & authentication](#)
 2. [Blocks list \(home\)](#)
 - [2.1 While data loads \(background sync\)](#)
 3. [Block inspections](#)
 4. [Inspection](#)
 5. [QR scanner](#)
 6. [About & settings](#)
 7. [Dialogs](#)
-

1. Onboarding & authentication

A branded welcome and the sign-in form. After signing in the user lands directly on the Blocks list, which downloads its data in the background — there is no dedicated sync screen.

Welcome — logo, tagline and Sign In entry point.

Login — "Welcome Back" email + password form.

2. Blocks list (home)

The landing screen after login: a searchable list of buildings, each with an overdue-inspection badge, a QR-scan FAB, and refresh / about actions in the app bar. A building with nothing outstanding shows a green check instead of a red count.

Default — buildings with red overdue-count badges.

All clear — a green check when a block has nothing due (e.g. Building 1).

With a draft — an amber Draft chip marks a block with an unsubmitted inspection.

Dark theme — full dark-mode rendering.

Offline — a cloud-off icon appears in the app bar when offline.

2.1 While data loads (background sync)

On first launch (and after a manual Refresh) the Blocks list populates in the background. The list stays visible the whole time:

- A brief centred spinner before any rows land.
- Each building row shows a **gray stripe and a thin loading bar** along its bottom, with **no badge or chevron**, and is **not tappable**, until that block's assets arrive. Blocks become ready independently — a small block can finish while a large one is still loading.
- A pulsing **cloud-download icon** ("Downloading data...") sits in the app bar on every screen until the sync completes. The header **Refresh** button is hidden while it runs.
- If the download fails, a SnackBar shows "**Failed to download data. Please retry.**" with a **Retry** action.
- If a sync settles with no data, the list shows an empty state instead.

Loading — both blocks loading: gray stripes, bottom progress bars, no badges, and the pulsing *Downloading data...* cloud icon in the app bar.

Empty — "No data loaded" with a Load data action (wipes + re-downloads in the background).

Manual Refresh: tapping the header refresh shows the [Refresh data?](#) confirmation; on confirm it wipes the local database and re-downloads everything using this exact background flow (no progress dialog). Offline-queued completions survive the wipe and are re-applied afterwards.

3. Block inspections

Inside a building: the list of inspectable assets, each showing schedule details (last completed, frequency, next due) and a status bar (red = due/overdue). Some assets carry extra attributes (floor/location) and an ⓘ info button.

Asset list — schedule details per asset with a chevron into the inspection.

Search — filter inspections by name/number.

With a draft — the in-progress asset carries a Draft chip.

Attributes & info — optional Floor / Location, plus an ⓘ info icon for assets with help text.

4. Inspection

The core workflow screen. An optional photo-evidence header sits above a list of checklist questions; answers, required photos and remedials are validated before an inspection can be completed.

Checklist loads on open. The first time an asset is opened its checklist is fetched if not already cached, showing a brief "**Downloading checklist...**" spinner (usually under a second, so it's not pictured here). If it can't be downloaded — for example when offline — the screen shows "**Unable to connect. Please check your internet connection.**" with a **Retry** button instead of the form.

Remedial required — a failing answer reveals a required remedial form (Title / Location / Description) and a required photo.

The screenshot shows a mobile application interface for a fire door inspection. At the top, the status bar displays the time 09:22 and various icons. The app header includes a back arrow, the text 'Building 1', and a red badge with the number '899'. The main title is 'Fire door inspection — 1'. Below this, the form contains the following elements: a section with 'Last completed: 14th Apr 2026', 'Frequency: 7 Day(s)', and 'Next due by: 14th Apr 2026'; a 'Photo evidence (optional)' section with a camera icon and '+ Click to add' text; a question '1. Does this door self-close fully into its frame from any angle, overcoming the resistance of any latch?'; a dropdown menu with 'Please select...'; a 'Photo required' label with a camera icon; an 'Add Photo' button; and a large blue 'Complete' button at the bottom. The bottom of the screen shows a dark navigation bar with a back arrow and a home indicator.

Dark theme — the same screen in dark mode.

Validation and draft-saving dialogs for this screen are in [§7 Dialogs](#).

5. QR scanner

Reached from the FAB. Scanning an asset's QR code jumps straight to its inspection.

Scan QR — viewfinder for scanning an asset's code.

6. About & settings

App info, appearance (System / Light / Dark), version, sign-out, and a debug data-audit action.

About — dark

7. Dialogs

Modal confirmations used across the app.

Refresh data? — confirm a full re-download. The refresh then runs in the background (see [§2.1](#)) — there is no progress dialog.

Inspection not complete — blocks completion when answers/photos/remedials are missing.

Save your progress? — Keep editing / Discard / Save draft when leaving an unfinished inspection.

Asset info — "What is it?" help text and source links for an asset.

Sign out? — confirmation before signing out and wiping local data.

Screenshots live in [docs/screenshots/](#). To regenerate the captures, run the app on a connected device and recapture with `adb exec-out screencap`. To rebuild the PDF: `md-to-pdf --stylesheet app-screens.css app-screens.md` (run from docs/).
